README

Copy file

- Read the guideline before starting.

Write a function `copy_file` that will copy a file in current directory like Linux cp command: `cp file.txt file-copy.txt` . Function take only one argument `command` , that is string with command `cp` , file name to copy and new file name, separated by spaces.

- It must do nothing in case the user is trying to copy file to file with the same name.
- Function must copy the whole content to new file. Example:

```
copy_file("cp file.txt file.txt")  # Does nothing
```

```
copy_file("cp file.txt new_file.txt")
open("file.txt").read() == open("new_file.txt").read()  # True
```

Note: You can use two contexts managers simultaneously by separating them by a comma:

```
with open(..., "r") as file_in, open(..., "w") as file_out:
    ...
```

Note: Check your code using this checklist before pushing your solution.
